

# Weather API Documentation

This project is a static html file that shows the weather forecast for 3 days from a given start date, for the given zip code.

## License

Copyright © Yener Tuz 2019

## Features

Displays high and low temperatures, a summary condition and an icon for 3 days from the given date, as well as the city and state name for the zip

## Installation and usage

Double click on the index.html file to launch it in a browser.

Click on the url bar and add “?zip\_code=xxxxx&date=mm/dd/yyyy”, replacing the xxxxx, mm, dd and yyyy values with your zip code, month number (1-12), day number (1-31) and year. Zip codes must be 5 digit US postal codes.

Example: ?zip\_code=95033&date=4/11/2019

This weather API is available for queries whose dates are between the current date up to and including 2 days after the current date. For example, if the current date is 4/10/2019, date values can only be 4/10/2019, 4/11/2019 or 4/12/2019. Anything else will not work.

Once the zip\_code and date values are correctly entered and formatted, press enter

## Support

Double check that your query parameter (everything in the URL that comes after the question mark ? ) are formatted correctly

Double check your date. Read the installation instructions and make sure the date is formatted correctly.

Double check the zip code to make sure it's a valid US postal code.
